

What is the Internet?

The Internet is like networks of networks which connects billions of devices together across the globe. These devices talk to one another by means of a communication network which can be wired or wireless. Internet contains huge information in various forms like web pages, application, emails etc.

It's an Email, News group, Chat groups and Marketplace. That's what it makes so huge. It gives instant access to the things that is happening everywhere. In today's time more emails over the internet are being delivered than the first class postal mails.

Nobody or Everybody controls the Internet. The whole distribution system is made up of independently operated large network. Operators make sure that there is end-to-end connectivity in every part of the network.
